In the Claims:

Please amend the claims as follows:

Claims 1–53 (canceled)

54. (currently amended) A medical device for use in a medical procedure comprising:

a manually graspable handle;

an elongated shaft projecting from the handle, the shaft being sized and shaped to be positioned through a small incision in the chest of a patient and defining a proximal section comprising a rigid, elongated metal tube and a distal section comprising metal and a rounded tip portion adapted to be slid relative to tissue, the shaft including a joint comprising a pin that moveably couples the distal section to the proximal section thereby allowing the distal section to pivot relative to the proximal section;

a non-conductive material surrounding at least a portion of the elongated shaft;

a remote actuator proximal the distal section for selectively controlling the actuation of the joint;

a power source comprising a battery; and

a light <u>located on the medical device and</u> electrically coupled to the power source; and

<u>a switch located on the medical device for activating the delivery of electrical</u> <u>power from the power source, wherein the light is visible when power is being delivered.</u>

- 55. (canceled)
- 56. (previously presented) The medical device of claim 54, wherein the distal section includes a passage.
- 57. (previously presented) The medical device of claim 54, wherein the distal section includes an opening.

- 58. (previously presented) The medical device of claim 54, wherein the distal section includes a hole.
- 59. (previously presented) The medical device of claim 54, wherein the distal section includes a slot.
- 60. (previously presented) The medical device of claim 54, wherein the actuator comprises a knob.
- 61. (previously presented) The medical device of claim 54, wherein the actuator comprises a button.
- 62. (previously presented) The medical device of claim 54, wherein the actuator comprises a lever.
- 63. (previously presented) The medical device of claim 54, wherein the actuator comprises a slide.
- 64. (previously presented) The medical device of claim 54, wherein at least a portion of the distal section of the elongated shaft defines a uniform radius of curvature.
- 65. (previously presented) The medical device of claim 54, wherein the handle is rigidly coupled to the shaft such that the shaft is readily manipulated via movement of the handle.
- 66. (previously presented) The medical device of claim 54, further comprising a sensor located at the distal section of the elongated shaft.
- 67. (previously presented) The medical device of claim 54, wherein the actuator is located at the handle.

- 68. (previously presented) The medical device of claim 54, wherein the proximal section includes an internal lumen.
- 69. (previously presented) The medical device of claim 54, wherein at least a portion of the shaft is malleable.
- 70. (previously presented) The medical device of claim 54, wherein the medical procedure is an ablation procedure.
- 71. (currently amended) A medical device for use in a medical procedure comprising:

a manually graspable, non-conductive handle;

an elongated shaft projecting from the handle, the shaft being sized and shaped to be positioned through a small incision in the chest of a patient and defining a proximal section comprising a rigid, elongated metal tube and a distal section comprising metal and a rounded tip portion adapted to be slid relative to tissue, the shaft including a joint comprising a pin that moveably couples the distal section to the proximal section thereby allowing the distal section to pivot relative to the proximal section;

- a non-conductive material surrounding at least a portion of the elongated shaft;
- a remote actuator located at the handle for selectively controlling the actuation of the joint;
 - a power source comprising a battery;
- a light <u>located on the medical device and</u> electrically coupled to the power source; and

an activator located at the handle for activating the delivery of power from the power source, wherein the light is visible when power is being delivered.
